The Smart ATM

Imagine you are developing a basic ATM calculation program. A customer has ₹5,000 in their account and wants to withdraw ₹1,350.
Write a program to:

1. Store the initial balance and withdrawal amount in variables.
2. Calculate the remaining balance.
3. Check whether the withdrawal amount is less than the available balance.
4. Check whether the remaining balance is greater than ₹1,000.
5. Calculate how many ₹500 notes and how much remainder will be needed to represent the remaining balance.

Use arithmetic and relational operators.
Name the .py file as ‘ATM_yourname.py’. And keep it ready for submission.
